Advantages of TCP pacing using FQ

Brian Tierney, ESnet
bltierney@es.net
<http://fasterdata.es.net>

TCP option: Fair Queuing Scheduler (FQ)

Available in Linux kernel 3.11 (released late 2013) or higher

- available in Fedora 20, Debian 8, and Ubuntu 13.10
- Backported to 3.10.0-327 kernel in v7.2 CentOS/RHEL (Dec 2015)

To enable Fair Queuing (which is off by default), do:

- `tc qdisc add dev $ETH root fq`

Or add this to `/etc/sysctl.conf`:

```
net.core.default_qdisc = fq
```

To both pace and shape the traffic:

- `tc qdisc add dev $ETH root fq maxrate Ngbit`
 - Can reliably pace up to a maxrate of 32Gbps on a fast processors

Can also do application pacing using a `'setsockopt(SO_MAX_PACING_RATE)'` system call

- iperf3 supports this via the `"--bandwidth"` flag

Advantages of Pacing

- The following plots show a clear benefit from pacing TCP
 - Proper pacing of flows can completely eliminate TCP ‘sawtooth’
- The advantage is even greater with parallel flows
- We recommend all Data Transfer Nodes (DTNs) use FQ-based pacing
- Pacing also helps with eliminate packet loss due to under-buffered network hardware, and under-powered security devices.

New York to Texas: With Pacing

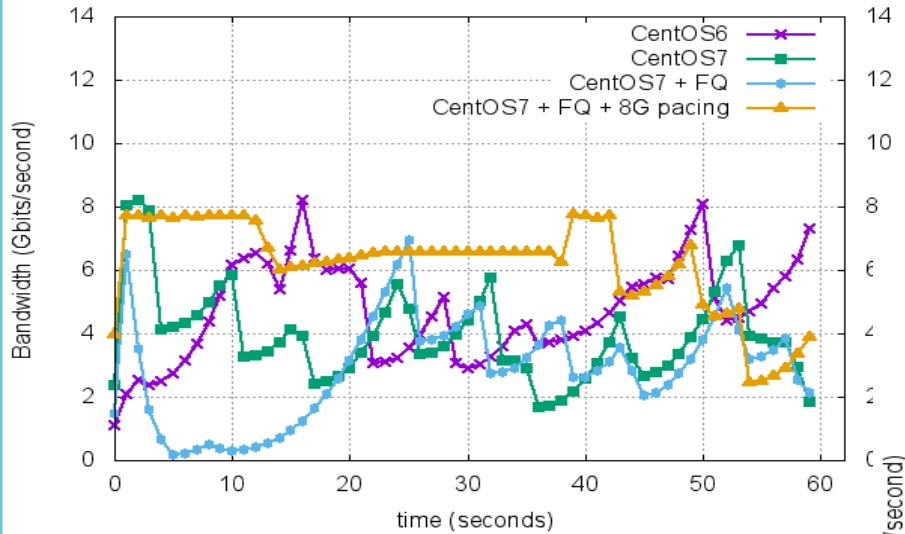

TCP performance: BNL to Pantex ; CentOS 6.5 vs CentOS 7.2
10G Host to 1G Host, $rtt = 88ms$

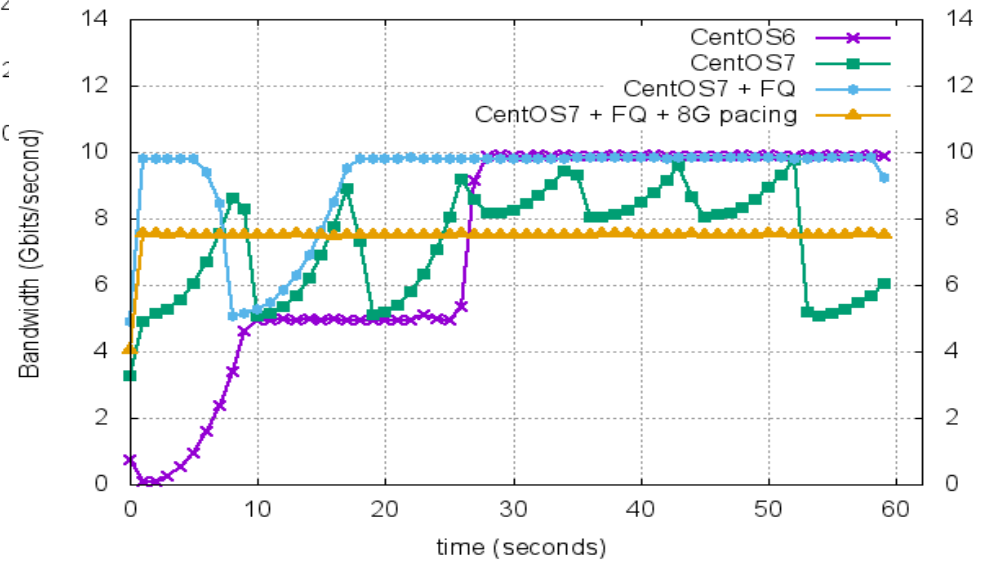

ESnet

More examples of pacing helping

TCP performance: CentOS6 vs CentOS7
LBL-to-iut2-net2.iu.edu

TCP performance: CentOS6 vs CentOS7
LBL-to-sdm00.rcc.uchicago.edu

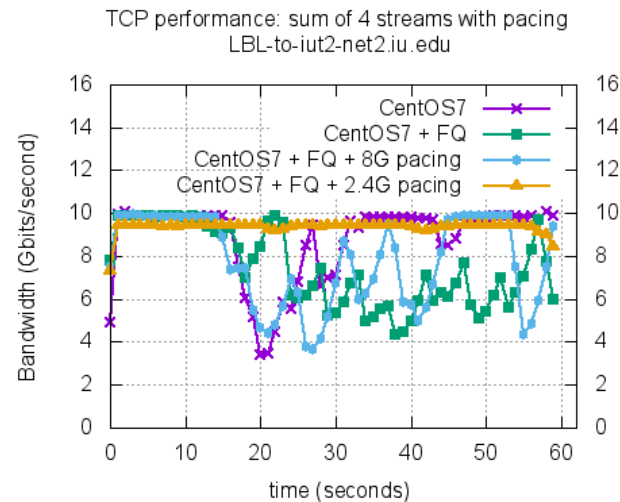

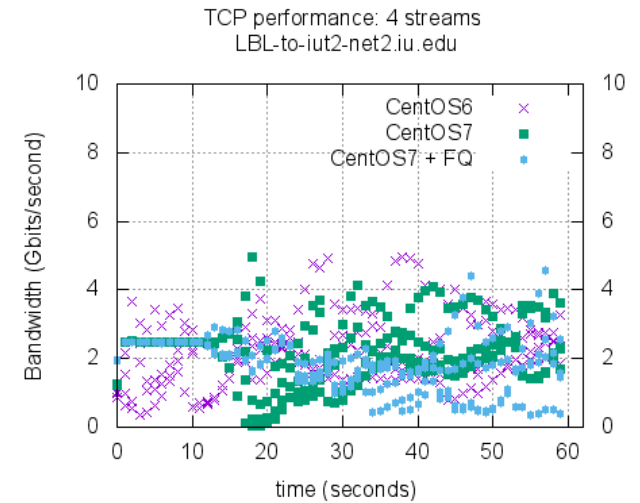

Parallel Stream Test 1

Left side:
sum of 4 streams

Right side:
tput of each stream

Streams appear to be much better balanced with FQ, pacing to 2.4 performed best

Parallel Stream Testing

Parallel Stream Test 2

Left side:
sum of 4 streams

Right side:
tput of each stream

Streams appear to be much better balanced with FQ

Parallel Stream Testing

100G Host, Parallel Streams: no pacing vs 20G pacing

TCP performance: 4 streams, no pacing, 100G, rtt = 92ms

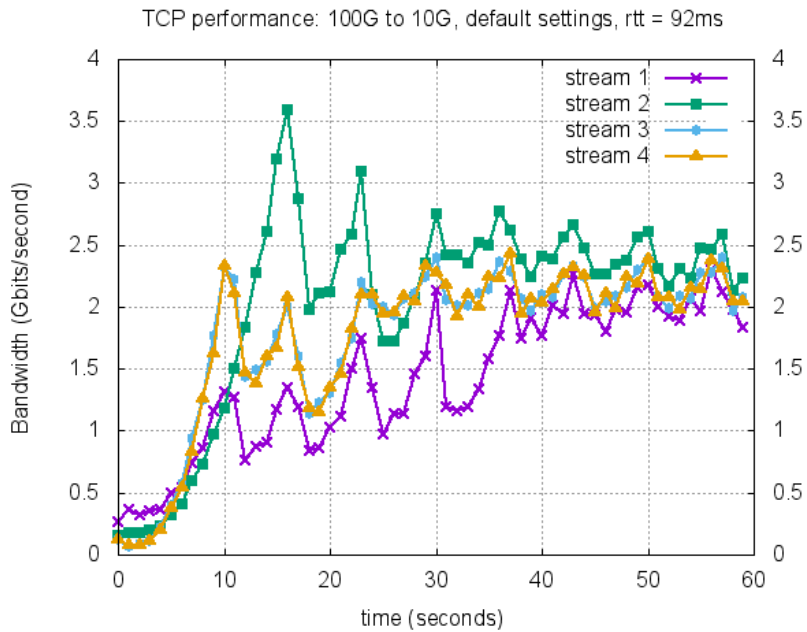

TCP performance: 4 streams, 20G pacing, 100G, rtt = 92ms

We also see consistent loss on the LAN with 4 streams, no pacing
Packet loss due to small buffers in Dell Z9100 switch?

100G Host to 10G Host

Fast Host to Slow host

Throttled the receive host using 'cpupower' command:

```
/bin/cpupower -c all frequency-set -f 1.2GHz
```

FQ Packets are much more evenly spaced

tcptrace/xplot output: FQ on left, Standard TCP on right

Run your own tests

- Find a remote perfSONAR host on a path of interest
 - Most of the 2000+ worldwide perfSONAR hosts will accept tests
 - See: <http://stats.es.net/ServicesDirectory/>
- Run some tests
 - `bwctl -c hostname -t60 --parsable > results.json`
- Convert JSON to gnuplot format:
 - <https://github.com/esnet/iperf/tree/master/contrib>
